VaR - Accuracy of VaR Methodology

The VaR method is intended to describe the level of loss that would be exceeded no more than 5% of the time. The method uses historical market data from the last 2 years. The graph shows the actual incidence of losses that are greater than the estimated VaR ("VaR Exceptions"). During 2008, exception rate was greater than 5% because actual market moves were much more volatile than the historical data. The selection of different confidence intervals may achieve different results, including a higher incidence of exceptions which exceed the VaR calculation.

VaR - Reliance on beneficial correlation between Traders

The VaR of BHM takes account of beneficially low correlations between traders. To account for situations where these correlations change sharply BHAM calculates the VaR assuming all traders are 100% correlated. This fully correlated VaR has usually been between 1.5 and 3 times the size of the regular VaR.

At 31 Jul 2014	BHM VaR (a)	0.5%
	Sum of trader VaR's (b)	1.2%
	Ratio (b/a)	2.27

Notes:

1. Calculated using historical simulation based on a 1 day, 95% confidence interval.
2. IR risks may exist for currencies other than those listed.
3. Geographical Exposure is based on VaR by region.
4. Figures are rounded to the nearest whole number. Therefore in some instances the total may not equal [100% / 0%].
